Attempt : 1 Total Mark : 10 Marks Obtained : 10

Section 1: Coding

1. Problem Statement

Ravi is developing a student registration system for a college. To efficiently store and manage the student IDs, he decides to implement a doubly linked list where each node represents a student's ID.

In this system, each student's ID is stored sequentially, and the system needs to display all registered student IDs in the order they were entered.

Implement a program that creates a doubly linked list, inserts student IDs, and displays them in the same order.

Input Format

The first line contains an integer N the number of student IDs.

The second line contains N space-separated integers representing the student IDs.

Output Format

Sample Test Case

while (temp->next != NULL) temp = temp->next;

The output should display the single line containing N space-separated integers representing the student IDs stored in the doubly linked list.

Refer to the sample output for formatting specifications.

```
Input: 5
   10 20 30 40 50
Output: 10 20 30 40 50
   Answer
   // You are using GCC
   #include <stdio.h>
   #include <stdlib.h>
   struct Node {
     int data:
     struct Node* prev;
     struct Node* next;
   void insertEnd(struct Node** head, int data) {
     struct Node* newNode = (struct Node*)malloc(sizeof(struct Node));
     newNode->data = data;
     newNode->next = NULL:
     newNode->prev = NULL;
     if (*head == NULL) {
        *head = newNode;
        return;
     }
     struct Node* temp = *head;
```

```
temp->next = newNode;
  newNode->prev = temp;
void display(struct Node* head) {
  struct Node* temp = head;
  while (temp != NULL) {
    printf("%d ", temp->data);
    temp = temp->next;
 }
}
int main() {
oint N;
  scanf("%d", &N);
  struct Node* head = NULL;
  for (int i = 0; i < N; i++) {
    int id;
    scanf("%d", &id);
    insertEnd(&head, id);
  }
  display(head);
  return 0;
                                                                    Marks: 10/10
Status: Correct
```
